A PV-WAVE (version 4.20 on Solaris 2.3) Array Question:

I have two string arrays, e.g.

 STRARR (5) = ['a','b','c','d','e']
     STRARR (2) = ['b','e']

I wish to find the elements which are common, i.e the result would be

 INTARR (2) = [1,4]

I am currently performing this in a FOR loop (sacrilege!). With WAVE's
array manipulation I would expect there to be a more elegant solution.

Any ideas would be much appreciated,
