All,

As many of you no doubt remember I have been an advocate for third party IDL software for years now. With the acquisition of RSI by Kodak I am convinced that this makes even more sense. Therefore I have created a site whose only purpose is to market third party IDL code at <http://www.kilvarock.com/> .

The purpose of this post is to let everyone know about the site and to see if others are interested in contributing code. I know that there are really slick routines that you all have created but aren't really interested in giving away for free. If you have something, then reply to the email address below.

So what is currently on the site?

1. Tab widgets (Really a tab base, allows tabs on top or bottom.)
2. Tree menu widget (Like the windows explorer browser.)
3. Advanced buttons (Put any image on buttons, glowing buttons, toggle, etc.)
4. MapViz - an IDL mapping add on.
5. IDL to PVM interface (available by Friday) - A DLM implementation that interfaces IDL with the Parallel Virtual Machine. With this you can use IDL to do parallel processing on Unix or NT networked machines.

I have put my best routines out there and I encourage others to do the same. Send an email to info@kilvarock.com if you are interested.

-Ronn
