Subject: IDLWAVE 4.9

Posted by Carsten Dominik on Thu, 12 Apr 2001 11:54:19 GMT

Hello X/Emacs users,

I have released IDLWAVE 4.9. As always it is available on my website

http://www.strw.leidenuniv.nl/~dominik/Tools/idlwave

CHANGES IN VERSION 4.9
======================

AUTOMATIC INITIALIZATION OF ROUTINE INFO IN IDLE TIME

  Up to now, the first completion or routine info command in an emacs
  session was delayed by loading the routine info. IDLWAVE now loads
  this stuff automatically when you are not using Emacs for more then
  10 seconds. This bright idea is due to JD, of course. It can be
  configured with the option `idlwave-init-rinfo-when-idle-after'.
  If you have a fast machine and network, you want to set this to

    (setq idlwave-init-rinfo-when-idle-after 2)

  If you have a very slow machine and network, a value of 30 or 60
  might be more appropriate.

DRAG-TO-PRINT

  To print a value of an expression in the shell, you can now also
  drag the mouse (holding down SHIFT) over the expression to print.
  Up to now IDLWAVE tried (with variable success) to guess the
  expression you wanted to print - now you have more control.

DIRECTORY-SYNC

  File name completion in the Shell now always starts in the current
  working directory of the IDL process.

BUGS FIXES

  - fixed problem with displaying buffers in different frames
  - The IDL function BEEP works again in IDLWAVE. This was already
    intorduced in 4.3, but somehow got lost again.
