
Subject: 2 variables on same plot?

Hi all,

How do I plot 2 variables on 1 plot? They each have vastly different ranges. I believe I am supposed to use AXIS but I can't seem to get the 2nd plot to be scaled correctly.

```
xt=indgen(365)
plot,xt(0:90),omega(0:90),xstyle=8,ystyle=8
axis,yrange=[0,11],ystyle=1,/save,yaxis=1,xaxis=0
oplot,xt(0:90),prate(0:90),linestyle=2
```

The 2nd y axis has values from 0 to 10 and the data ranges from 0 to 10 but it is plotted from 0 to .001 or something like that.

thanks

Cathy Smith
