
Subject: Annotating Radar Images

I would like to know how I can annotate images. I am displaying radar images from a binary data file, using the TV command. These image files have a header, in which information about the particular image is stored. I will like to add this information as a 'footnote', as well as annotations along the borders. Also, I would like to produce a postscript output of this image. I've tried used the !P.Multi keyword, with no success.

Is there any way in which ticks could be added to the images, as it is done with contour and surface plots.

Thanks in advance
Shaheen
