OK, this is highly platform specific...

I use a Mac running OS-X as an X-windows client (using Xtools from Tenon) to an SGI machine.

When using IDL (or IDLDE), the "window" command is supposed to open a new window. It just hangs when run in Xtools. I don't know what's specific about those windows, but I get tons of "X window protocol error: BadValue" in the console when starting IDL.

Opening other X-windows do not cause problems; and if I use another X-windows manager (twm or WindowMaker in XDarwin) IDL works.

Any clue ?

"The term reboot comes from the middle age (before computers). Horses who stopped in mid-stride required a boot to the rear to start again. Thus the term to rear-boot, later abbreviated into reboot."
