---

Does anyone have any suggestions on how to get the correct 3-D position using the Pickdata method for an IDLgrWindow object which is displaying an IDLexObjView. Pickdata correctly finds the objects but returns incorrect x,y,z values. I am trying to modify xplot3d.pro to return the x,y, and z coordinates of a IDLgrPolyline displayed using Orbs for each datapoint.

Thanks,  
Don Lindler
