
Subject: calling FORTRAN under Ultrix

Hello, IDL users -

Would someone be so kind as to send me a simple example of calling a FORTRAN procedure from IDL under Ultrix? I used CALL_EXTERNAL for this under VMS, but that's not available in Ultrix. I need to pass variables both ways. I've tried to use SPAWN to produce a child process, but don't have it quite right yet.

I would really appreciate a nudge in the right direction...
