---

hi,

i am a fairly new idl user and need some help.

i currently have images from the meteosat satellites, which i am trying

to convert to latitude/ longitude coordinates. i have managed to create

arrays for the latitude and longitude of each pixel, but this is as far as i have got.

i have tried using liam gumleys imagemap program, but without success.

the most common complaint idl has with this

program is that i have reached the end of file before the end of the program.

has anyone got any ideas what i might be doing wrong?

any help would be great.

alison lucie
