hi, there,

Yesterday, I post a message. Since it has the same subject of the previous one. It got confused. So I bother to post it again. Wish I can get good results.

The ones who used label_region in IDL must be suprised at the efficieny of this function. But how can I find out what algorithm is used in LABEL_REGION? Since I do not see this function in the library, I assume it is written in C somewhere.

Julia
