Hello.

Sorry! I guess, that this question has been asked before for many times, but I cannot find the answer on the net ...

Here is the question: How can I reduce the number of colors PV-Wave uses from true colors (the default of my X-Server)

to 8 bits without starting a new X-Server? I tried !D.N_COLORS=256 (which is a readonly field :-() and I tried

the Win32 keyword DECOMPOSITION=0, but none worked for obvious reasons. Can anybody help me with this?

Thanks and regards

Bernd
