Hi!

I'm working on a vax with IDL 4.0 :) I have a HUGE binary file, with sequential, variable length records separated by a carriage return carriage control character. The problem is that the records aren't in the right order! Each record has a header with a time stamp that I can use to sort the file with. Any suggestions on how to read from the file and figure out where each record begins? I've tried so many things! Please help! My thanks are yours; Lucas.
