---

I am displaying small parts (e.g. 16x16 pixels) of images and need to zoom regions up to a size large enough to see the relative brightness of the pixels. The ZOOM procedure does exactly what I want, but in an interactive mode. Does anyone know of a function or procedure or other means that would allow me to include this feature in my program to automatically zoom a preselected subregion of the image? REBIN, and CONGRID resample and that is not what I want, I just want the intensity in each original pixel to be reproduced everywhere in a synthesized, larger pixel, ideally whose size I can choose.

Any suggestions are greatly appreciated.
