(periodic posting)

I need to successfully do CALL_EXTERNAL with IDL for Windows, using external FORTRAN code, preferably compiled and linked with WATCOM/32. Don't tell me what it says in the manual, I've done this extensively on IDL/VMS with shared image libraries, but the 16bit DLL support to do the same under IDL/Windows really sucks. If anybody has any help for me (preferably a template procedure/FORTRAN subroutine pair) I would appreciate it.
