Subject: Fortran + IDL

Posted by fskhk on Tue, 14 Aug 2001 08:39:06 GMT

I am working in Fortran (with a complicated program) and IDL. Up to
now I put the output of the fortran data in a text file, go to IDL,
read the text file in IDL and draw the graphs. For every small change
in fortran I have to go in and out the fortran program and IDL
program. Will it be easier and better to use ActiveX or Callable IDL
under Windows? How and where can I learn to make the linkage?
