Hi,

there is example code in the online-manual datamine.pdf. I am investigating the possibilities of Dataminer myself, you might want to read the thread IDL/Dataminer/mySQL where I have posted some sample code I used to test the connection to a database.

Basically you need to create the two objects IDLDBDatabase for the connection and IDLDBRecordset to access the data in the tables.

You need to create the right DSN entries in the ODBC-Setup first (Windows,
don't know yet how to do this under Unix)!

Olaf
