I would create a button using CW_BGroup, like this:

```
buttonID = CW_BGroup(parentWidgetID, 'some description', /Col,  
/NonExclusive, Set_Value = InitialState)
```

The " /Col " puts the description text to the right of the toggle
button. "InitialState" is set to "0" or "1" (unchecked or checked).

To determine the current state of the button, use:

```
Widget_Control, buttonID, Get_Value=CurrentState
```

Note that, as David suggests, you need to store the buttonID variable
somewhere.

Is this what you were asking for?
