
Subject: Dataminer and mySQL?

Hello *,

we recently decided to use IDL in the future with the experimental data we collect here. I will receive a 30-days test-license soon and already read some pages in the online-manuals. One question that could not be answered by RTFM is the following:

Is it -in principle- possible to use the dataminer in combination with a mySQL-Database? There is a ODBC-Driver for mySQL but I have not seen any "success-stories" in the archive at groups.google.com!

A very special question: The tables in our mySQL-database contain fields with type DATETIME. According to the manual there is no corresponding IDL-Type to DATETIME, will I be able to use these tables at all in IDL?

Greetings,

Olaf
