Hi guys!

I am puzzled by a problem the last 2 days , hope you have a solution for me.

I have a run-time application running on a Solaris Maschine (Idl 5.0.3) , and this application had a problem reading several data . I had a look at the Code of this application and i found out that it was a Unix - script problem (on the Solaris Maschine !the Code was Correct) . By running the Original Code (*.pro files) after correcting the Unix script everything was Ok and i could finally read the data i wanted to . But , as i tried to do the same with the run-time code (it is the same code i used before, only as *.sav files - i didn't create new files from my *.pro files, that was the original run-time application) i still couldn't read the Data.

Can anybody help me?

cu
