
Subject: User functions and data name conflicts

Our system have just upgraded to a new IDL with more user functions, one of these new ones is pm, and obsolete procedure to print matrices, one of the structured variables I have been using for the last few years also has this name and I have a few 1000 lines of code using this variable in various ways, now none of my code runs as the variable conflicts with the function, is there any way to tell IDL to ignore this particular user function or do I have to go back and change my variable name?

Thx

Ricky Smart
