---

I'm using IDL 5.3 on a RedHat 7.0 system. In IDLDE, I occasionally get random ctrl/M's thrown into the text. Most of the time, IDL doesn't like those extra returns and throws a hissy fit... I think I've identified when/why it occurs and am wondering if anyone else has seen it/has a solution for it.

It seems to only occur when I set/clear breakpoints and the extra character is almost always near the start of the line is the breakpoint on, but occasionally may appear in either the line before or the line after the break.

Sound familiar to anyone?

Bruce
