You could use widget_text, then, by modifying the code above to include
the following (sorry for not providing this to start with :-):

```
junk = where(strsplit(rs, string(1b), /extract) $
 ne theText, comp=good_rows, ncomp=count)
if count ne 0 then theText = theText[good_rows]
Widget_Control, textID, Set_Value=theText
```

Its not copyrighted, you know :-)
Cheers,
Pavel
