Subject: building argument list for addRecord in Dataminer

---

I have the rows of a table widget that I want to insert to a database table via Dataminer. For example, if I have an array of structures called values from a table widget, then I would like to use addRecord for each row in the table. I thought I could just do

```
ors->addRecord, values[i]
```

but values[i] is a structure, so that isn't right, and addRecord is expecting a list of fields. I tried building up a string containing the fields and then called addRecord with

```
ors->addRecord, arglist
```

but only the first field was written. (It turned out that the first field was also a string, but other fields weren't) I believe what I need to do is get this structure into a list of arguments and call addRecord with the correct number of arguments, but I don't know how to build this. I'm think of something like 'apply' in Python.

One other idea I haven't tried yet. Should I build up a SQL command and call sqlExecute?

Thanks.
