Hi,

I am new to IDL, and was investigating the possibility of writing a little application to do some image processing. I am working on a Unix system that has two monitors attached. I want to have one monitor have the controls for the processing and the other monitor have the image display. Is this possible using IDL? In my setup the two displays are machinename:0.0 and machinename:0.1. I cannot seem to find anyway to do this. Any thoughts?

Thanks for any ideas.
