sean,

here are some examples of long string output with&without imbedded linefeed characters.

print, astr

LF=string(10B)

best of luck,
george

My simple problem is that I am out of room to write the code on one line

> Normally, you can use the '\$' to continue your code on the next line

However, this does not work inside strings. Is there an analogous character

> or magic combination of characters that does the same thing? If not, how

> can I format my ridiculously long and complex output?

Learn more about my [Wearable Tech](#) and [Smart Home](#) projects.
