Hi,

Does anyone if its possible to use a function or variable as a parameter
or option to FORMAT ?

;e.g. if I have

print, blah, FORMAT = '(2(F6.1))'

; but I want something like this

for var = 0, 10 do \$

print, blah[var,*], FORMAT = '(var(F6.1))'

Any help please will be much appreciated

Paul M.
