Hi,

Does anyone if its possible to use a function or variable as a parameter or option to FORMAT ?

;e.g. if I have

```
print, blah, FORMAT = '(2(F6.1))'
```

; but I want something like this

```
for var = 0, 10 do $
```

```
print, blah[var,*], FORMAT = '(var(F6.1))'
```

Any help please will be much appreciated

Paul M.
