Okay,

I've got the lisp code for idl-shell, (and for idl-mode).
idl-mode works fine, but, when I do M-X idl-shell, I get the
message:

Searching for program: no such file or directory, idl

Does this mean it can't find my idl program code? How do I give
it the necessary path (I know that we have a strange idl path...)

Thanks in advance. Please respond via email, too...

Mike
