I am running IDL on a Windows platform.  
When I take my projects and via the BUILD  
command make a \*.sav file, the performance  
of that file is not the same as running the project  
from within IDL. Especially there is a problem  
when calling external routines or modal widgets.

If I run the \*.sav file the program always hang  
at the following location

Start\_Calculation, group\_leader=Event.top

Start\_Calculation is a \*.pro file

I have tried to change the build order, but it  
does not help. Any other suggestions to improve  
the \*.sav file??
