Hi!

I want to use the function CALL\_EXTERNAL to call code written in C. I have a lot of input and output actions with printf and i want these to be performed by IDL. In the external development guide they say to use IDL\_Message, but i just don't know how. It's defined at export.h but i cannot find it. I know this might sound as a stupid question, but i'm just a student. Is there an easy way to perform input and output with a C code?

Thanks in advance

Jesús
