
Subject: Sun fonts on DECWindows

I am trying to run IDL on a Sun and display on a VAXStation (VMS) or on a Tektronix XP-29 terminal. On either display it works fine until I run IDL Widgets: when I do I get a fatal IDL error (i.e. exit IDL) on the Sun about a "Button font" not found. Does anyone know of a font alias file I can use to substitute a DECWindows font for the missing Sun fonts or another way to fix this problem?
