HiGuys!

I am facing some problems in plotting color postscripts in PVWAVE. Can anybody out there help me? I will appreciate any pointers.

Here are the problems....

1)

I am trying to create a color postscript file and import it to microsoft word. When I take print out of the document, I don't see any plots. Does anybody know what's going on? By the way, when I viewed the ps file using ghostview it was fine and all the colors and the plot came up right. Also, the microsoft reads the ps file fine. I don't get any error messages.

2)

When I created encapsulated color ps file, nothing showed up in ghostview (%\$#%\$#%#) ?????

3)

Basically what I want to do is:

I want to create color encapsulated files in pvwave and then import these files into power point and prepare slides. If anybody knows of anyway I could accomplish this, could you please reply in this news group or at alps@iastate.edu

I need your badly

Thanks

Alps
