I know that you do not list 5.5 beta but others might be interested...

On win2k sp-2, with 5.3, 5.4 and 5.5beta installed the uninstall of 5.5beta really screwed up the works. After uninstalling 5.5beta using the "Add/Remove Programs" control panel, every time I started IE windows installer would run. After a number of "Cancels" windows installer would go away and IE would run. A real pain.

The fix (known well to windows users) was to uninstall ALL versions of IDL. After all versions of IDL were uninstalled IE was happy.

This of course may NOT happen in every case but I am not in the mood to test this on a second machine right now.

So windows beta testers beware. Have your licensing info and old IDL cds ready to go if you uninstall 5.5beta.
