Hi, all,

Sorry for asking this question if it has been posted before, I tried to search this subject in the newsgroup, but failed.

Let's suppose we put several identical "test.sav" files in different directories, all these directly are included in IDL searching path, but we have no idea about their order.

If we fire up 'IDL', and execute "test", is there an easy way to know which 'test.sav' IDL first found and execute?

Many thanks in advances,

Xiangyun
