
Subject: convert string into the name of a variable

Hi!

Is there anybody who could tell me if there is an IDL instruction, like
in Matlab, able to convert a string into the name of a variable and
vice-versa? I mean if I have defined :

```
a=1  
b=2  
list=['a','b']
```

I would like to write:

```
print,somme_instruction(list[0])
```

and to get:

```
1
```

Thank you

Frederic
