Subject: procedure/function assigned to table widget cell?

Is there a way to set up a table widget so that if I right-click on a
table cell I can execute a procedure that will execute a procedure
where I get the data from the table with /USE_TABLE_SELECT (or is it
/USE_TEXT_SELECT? I don't have the manual handy. Sorry.) I want to
select a single cell of a table and do something with it. I don't want
to do the procedure everytime the cell is selected, but only when
something else like a button press or something happens. I was trying
to put a button in the same top level base, but couldn't figure out
how to tie the two together. I need this functionality in more than
one table, so it needs to be somewhat general.

Thanks for any help.
