hi,

i have a code that can display an image of type .dcm and i have written code to segment that image. I have 195 slices of these 512 x 512 image. I need to save that segmented image for each slice and then display them together to get a 3D of the segmented image. Can anybody tell me how to save the segmented image and retrieve them later for further processing.

Thanx in advance,

Regards,

Akhila...
