Hi!

I just installed IDL 5.3 on a PC as usual: Insert CD, locate setup.exe, press shift+right mouse button and choose 'Install as...' and then start the setup as administrator. I do this because when I log out and re-login as administrator, other users seem to have no rights to change the preferences. Well, sometimes they still can't, but that's another story.

What happens now is that when starting IDL, it seems it does something like this first:

```
for i = 1, 2 do begin
  dummy = dialog_message( 'Access denied', /error )
  dummy = dialog_message( 'Configuration file corrupted', $
                          /error )
endfor
```

This does not seem to be a problem, though, everything is working fine as far as I can tell. But I still wonder what this might be.

Alex, with 378 unread messages in this group...
