Hi

I am new on IDL and actually have just installed the trial yesterday.
I am wondering could anyone help and provide me some sample on the following task:

Open and read a BMP file

And then carry out a 2D-FFT

Save the result as BMP file, but with data shifted such that DC component is in the middle of the image.

Can it be done easily with only a few command ?

Would you show me how ?

Many Thanks in advance

Best Regards

John
