
Subject: spectral angle mapper algorithm

Hi

I'm trying to access the ENVI-based spectral angle mapper function within IDL. I found the following function call definition:

ENVI_IDENTIFY_SAM_SETUP wl ref spec_lib handles NUM_SPEC

I assume wl represents the wavelength (range??), ref is the input image, and spec_lib is the .sli file. I'm not sure what handles and NUM_SPEC are, although the latter is optional (?).

Any help would be much appreciated.
