
Subject: bug in curvefit?

I had to re-code a piece of curvefit, since the matrix multiplication did not quite work out.

Instead of

```
alpha = transpose(pder) ## (Weights #  
(fltarr(nterms)+1)*pder)  
in rsi's curvefit.pro
```

I had to use (note the change of ## -> #)

```
alpha = transpose(pder) # (Weights # (fltarr(nterms)+1)*pder)
```

Anyone else had the same issue?

Mirko
