Subject: bug in curvefit?

I had to re-code a piece of curvefit, since the matrix multiplication did not quite work out.

Instead of alpha = transpose(pder) ## (Weights # (fltarr(nterms)+1)\*pder) in rsi's curvefit.pro

I had to use (note the change of ## -> #)
alpha = transpose(pder) # (Weights # (fltarr(nterms)+1)\*pder)

Anyone else had the same issue?

Mirko
