part 2,

I did (finally) apply the "workaround" that www.RSINC.COM gave for the "color problem in IDL 5.5 on linux" (correctly) but all I get now is greyscale. No colors (although the hideous yellow rectangle did go away).

So, apparently the problem is to change my setup to less than 24bit color. That is not something I can do on the fly in IDL since following "workaround B" from RSI does not change the display on my system.

So, please ignore my posts (if they ever do show up on the group)

Cheers,
bob stockwell
