Dear all,

I am a complete newbie to IDL, and here's probably a very easy question for you guys;

I am trying to divide one image by another (i.e. pixel by pixel), where the pixel intensity is quite similar in both pictures. I then want to create a third image as the result of the division.

I read in the two images and define a `fltarr` for the division. The result I get is an image with either 0.00000 or 1.00000 intensity. For some reason it seems that the result of the division is an integer number. Can someone help? Cheers,
Carsten
