
Subject: resizing tlb with /align_right, /align_bottom

I have a tlb which is split up into two rows (top_base, bot_base), and each of these row bases are set up as columns. (2x2 grid for now.) Each sub-base only has a droplist and a set of buttons in them. There are no draw widgets in this. When I resize the window, the sub-bases basically follow the upper left corner as if everything was set up for /align_left, /align_top. I have already written code to resize table widgets by getting the geometry (thanks to this NG), but I can't seem this to work. I've tried all sorts of combinations of /align_right, /base_align_right, etc.

I'm sure I'm misssing something simple. Any help is appreciated.
