
Subject: Creating embedded license .sav files

I have been using idlde to build a large project we have here and create a .sav file with the license embedded, but it is not very convenient. It requires adding every new .pro file to the project with idlde manually, building the project manually, and then exiting idlde. Since the license to create these embedded license save files only exists on one (Linux) machine this means that it can only be done from a machine with an X server running on it.

Does anyone know a way to create an embedded license save file using only command line IDL? If so I can do a "find . -name "*.pro" -print" to make a batch .pro file which just compiles everything in a hierarchy, resolves it all, and spits out our .sav file with the license embedded. Would be nice to be able to build a new version with a cron job instead of having to fire up the idlde every time we want a new build.
