Subject: strange linestyle=1 problem

Hi, I'm trying to make a diagram, which happens to contain many straight dotted lines with different lengths and angles. Oplot, with linestyle=1, is meant to give dotted lines, but they're more like very short dashes - normally this is no problem. However, it seems the dashes change length and thickness, depending on the length and angle of each line, so the lines all look quite different. It isn't a display problem, it's like this in the postscript file (at highest magnification, or printed on different printers). It doesn't seem to be a problem with IDL's postscript 'pixel size'...? Is there any way to get 'dotted' lines that look exactly the same, independent of their length/angle?

thanks,

Richard
