Continue to ask questions on Object Graphics with answers seem hiding deep in IDL help ;-)

Do IDLgrFont or IDLgrText allow choosing national character set (Cyrillic in my case) of TTF fonts on Windows?

In Direct Graphics I use DEVICE, SET_FONT & XYOUTS, FONT = 0 and font is set as Cyrillic as default, because I have Russian version of Windows. In OG I get only rubbish. May be some font modifiers doing this?

And may be anybody can advice free procedure for interactive font picking for Windows?

Thank you in advance.

Best regards,
