 We are looking for a high-quality frame grabber to grab 24-bit color images from a light microscope. Does anyone have any experience with or suggestions for this sort of thing? It has to run with a dual-head video card.
 Leads are greatly appreciated. I haven't been told that money is a problem. :-)

I use a frame grabber from Imagenation:
http://www.imagenation.com/
I have been pretty happy with it. They provide good support, and they even make drivers that run under DOS 6.0 :).
Cheers,
Dan
