On Win32, it is set in the registry keys:

HKEY_LOCAL_MACHINE/SOFTWARE/Research Systems, Inc./IDL/0/IDL
DLL/HGraphicWind

HKEY_LOCAL_MACHINE/SOFTWARE/Research Systems, Inc./IDL/0/IDL
DLL/WGraphicWind

Note that the "0" refers to the IDL installation and may differ on your machine.

For Unix, I would assume there is a text config file somewhere. I would guess there would be something similar on Mac.

You could change them all programmatically (if that is what you want to do). The config files could be read and rewritten (depending on permissions), and on windows you could craft a .reg file and then execute regedit to modify the key. You could also write a simple .dln for windows to add/edit reg keys.
